The surveyed limestone reserves on company land amount to 65 million tonnes but there are also some unsurveyed deposits. In addition there is limestone in the vicinity of in excess of 20 million tonnes.

The limestone is a carbonatite. This is volcanic in origin, unlike most limestones which are sedimentary rocks. As a result it is much harder to quarry and crush than most limestones.

**Hyrdate of Lime - Our Principle product.**
Our principal product is Calcium Hydroxide (Slaked Lime). This product complies with International Standards such as BS 8892 and has a typical pH of 11.3. It can be used on stucco walls and has a lime green or grey in colour but works just as well as whitewash. Production capacity is 90 tonnes per day, packed in 25 kg sacks.
